RenderCoat

Waterproof scratch coat for external use

RenderCoat

The AlphaChem Rendercoat is a high-performance render bonding agent designed to enhance adhesion on external surfaces such as concrete, lightweight blockwork, and brick. This product incorporates fine aggregate particles suspended in a unique waterproof polymer, ensuring easy application with a roller or brush and an even distribution of aggregate, thereby eliminating weak spots in the key coat and preventing particle loosening during application.

AlphaChem's Rendercoat effectively reduces the porosity and suction of the base substrate while providing a robust mechanical key through the suspended fine aggregate, ensuring a strong bond for the render.

Using a render coat prior to rendering offers several benefits that enhance the quality, durability, and appearance of the final render. Here are the key advantages:

- **Improved adhesion**
- **Surface preparation**
- **Reduced porosity and suction**
- **Weatherproofing**
- **Application ease**
- **Cost effectiveness**
- **Enhanced performance**

In summary, using a render coat prior to rendering significantly enhances the performance, durability, and appearance of the render, ensuring a high-quality finish that stands the test of time.
